FacePass Android版MegSafe软授权操作指南 V3.4.2

- 1. App在启动进入主界面前,必须先进行授权激活操作;没有授权的设备,在加载人脸算法SDK时,会导致应用直接闪退。
- 2. 相关文件列表
 - a. SDK/libs/authapi-release.aar MegSafe软授权接口
 - b. Doc/get authed file.py 联网获取授权文件的脚本 (新的授权aar包里,有接口实现这个脚本的功能,这个脚本可以不用)
 - c. Demo/TestFacePass_MegSafeMegSafe 软授权使用demo, demo中的lib目录包含了人脸算法sdk包(FacePassAndroidSDK-MegSafe-release.aar)
 - d. Demo/MegSafe AuthServer 如果用户授权方式使用代理服务器,则需要用到这里面的程序
- 3. authapi-release.aar接口使用说明:
 - a. 配置app工程的build.gradle 添加相关的库文件到当前使用人脸算法SDK的工程,如下图所示:

- b. 在进入用户程序主界面前,先进入授权页面,这步由用户自行实现。也可参考demo中的流程:SplashActivity->AuthActivity→MainActivity.
- c. 获取设备的指纹文件,接口如下:
 - i. AuthApi obj = new AuthApi();
 - ii. ReturnInfo text = new ReturnInfo();
 - iii. obj.GenC2vFile(text);
 - 上面三步调用,将在/sdcard/根目录生成request.c2v文件,该文件为设备的指纹文件。参考AuthActivity模块中的 generate_fingerprint函数。

```
generateFingerprint参考代码

private void generateFingerprint() {
    AuthApi obj = new AuthApi();
    ReturnInfo text = new ReturnInfo();
    obj.GenC2vFile(text);
}
```

d. 联网激活设备

方式一: 端上联网获取授权文件并激活设备

1) 端上主要接口

端上联网授权接口

```
a) String GetAuthFileByKey (String KeyFileName)
/sdcard/Download/v2c
         httpGetNetResult
ok, http
MyHttpHandler.GetErrorInfo()
b) String GetNetResult()
ActiveAuth
"ok" v2c
            "false" v2c
            "org"
{\tt MyHttpHandler.GetErrorInfo()}
c) /sdcard/Download
String path = "update.v2c";
AuthApi obj = new AuthApi();
final ReturnInfo retunInfo = new ReturnInfo();
obj.AuthDevice(path, retunInfo);
ReturnInfo text"Apply update: OK""Apply update: Update already added"
```

2) 端上参考代码

端上联网获取授权

```
private boolean getActivateFile() {
        NetApi api = new NetApi();
        return api.GetAuthFileByKey("CBG_Android_Face_Reco---89-Trial-one-stage.cert");
private class authThread extends Thread {
        @Override
        public void run() {
           try {
                    boolean res = getActivateFile(); //
                    if (!res) {
                        Log.d(TAG, "after getActivateFile result: " + res);
                        runOnUiThread(new Runnable() {
                            @Override
                            public void run() {
                                showAuthResult("getActivateFile fail ... ...");
                        });
                        return;
                    }
                    //getActivateFileFromHost(); //
                    Thread.sleep(1000);
                    while (true) {
                        String netRes = MyHttpHandler.GetNetResult();
                        Log.d(TAG, "GetNetResult: " + netRes);
                        if (netRes.equals("org")) {
                            Thread.sleep(1000);
                            String errInfo = MyHttpHandler.GetErrorInfo();
                            Log.d(TAG, errInfo);
                            continue;
                        } else if (netRes.equals("ok")) {
                            break;
                        } else {
                            String errInfo = MyHttpHandler.GetErrorInfo();
                            Log.d(TAG, errInfo);
                            return;
                    }
                    Log.d(TAG, "before ActivateDevice");
                    String path = "update.v2c";
                    AuthApi obj = new AuthApi();
                    final ReturnInfo retunInfo = new ReturnInfo();
                    obj.AuthDevice(path, retunInfo);
                    runOnUiThread(new Runnable() {
                        @Override
                        public void run() {
                            showAuthResult(retunInfo.retInfo);
                    });
                    Log.d(TAG, retunInfo.retInfo);
            } catch (InterruptedException e) {
                   e.printStackTrace();
       }
    }
```

方式二:通过代理服务器联网获取授权文件并激活设备

1) 代理服务器配置及运行

当前仅支持window 平台, 具体请参考代理服务器的使用说明(Demo/MegSafe_AuthServer)。

2) 端上主要接口

端上联网授权接口

```
a) boolean GetAuthFileByProxy (String AuthSvrIp,
   String AuthSvrPort, String KeyFile,
   String ActiveCode)
v2cGetNetResult
AuthSvrIp: ip
     AuthSvrPort:
     KeyFile:
     ActiveCode:
b) String GetNetResult()
ActiveAuth
"ok" v2c
            "false" v2c
           "org"
MyHttpHandler.GetErrorInfo()
c) /sdcard/Download
String path = "update.v2c";
AuthApi obj = new AuthApi();
final ReturnInfo retunInfo = new ReturnInfo();
obj.AuthDevice(path, retunInfo);
ReturnInfo text"Apply update: OK" "Apply update: Update already added"
```

3) 端上参考代码

端上联网获取授权

```
private void getActivateFileFromHost() {
       NetApi api = new NetApi();
       api.GetAuthFileByProxy("10.156.xxx.xxx", "6666", "CBG_Android_Face_Reco---89-Trial-one-stage.cert", "");
private class authThread extends Thread {
        @Override
        public void run() {
           try {
//
                      boolean res = getActivateFile(); //
11
                      if (!res) {
11
                          Log.d(TAG, "after getActivateFile result: " + res);
//
                          runOnUiThread(new Runnable() {
11
                              @Override
                             public void run() {
11
//
                                  showAuthResult("getActivateFile fail ... ");
//
                          });
11
//
11
                          return;
                      }
//
                    getActivateFileFromHost(); //
                    Thread.sleep(1000);
                    while (true) {
                        String netRes = MyHttpHandler.GetNetResult();
                        Log.d(TAG, "GetNetResult: " + netRes);
                        if (netRes.equals("org")) {
                            Thread.sleep(1000);
                            String errInfo = MyHttpHandler.GetErrorInfo();
                            Log.d(TAG, errInfo);
                            continue;
                        } else if (netRes.equals("ok")) {
                           break;
                        } else {
                            String errInfo = MyHttpHandler.GetErrorInfo();
                            Log.d(TAG, errInfo);
                            return;
                    }
                    Log.d(TAG, "before ActivateDevice");
                    String path = "update.v2c";
                    AuthApi obj = new AuthApi();
                    final ReturnInfo retunInfo = new ReturnInfo();
                    obj.AuthDevice(path, retunInfo);
                    runOnUiThread(new Runnable() {
                        @Override
                        public void run() {
                            showAuthResult(retunInfo.retInfo);
                    });
                    Log.d(TAG, retunInfo.retInfo);
            } catch (InterruptedException e) {
                   e.printStackTrace();
       }
    }
```

4. 激活设备后,才可以进入主界面。

需要由用户自己去记录设备的激活状态,只有激活成功才能进入主界面,才能使用人脸sdk算法
